

SKML performance goals

Reporting and scoring
With scope on improvement

Dr. Marc Thelen

- Marc Thelen, Born 1967
- European Specialist in Laboratory Medicine, Clinical Chemist
- Medical Manager Laboratory for Clinical Chemistry
Amphia ziekenhuis, Breda, the Netherlands
- Director of SKML, Dutch Eqas Organisation
- NVKC quality committee, since 2003
- Chaired transition from CCKL to ISO15189 in the Netherlands
- Chair of IVD committee NEN, Dutch standard organisation
- Participant member of ISO TC212 WG1
- Member of EFLM QC WG IVD
- Corr. Member of EFLM QC WG accreditation

- Client perspective
- What are EQAS organisers needed for?
- ISO 15189 accredited labs need:
 - 4.12 continuous improvement
 - 5.3.1.4 metrological traceability, ISO17511
 - 5.5.1. selection, validation and verification of methods
 - 5.5.1.4 measurement uncertainty
 - 5.6.3 interlaboratory comparison including corrective action

1. Method validation, verification

- T=0

trueness and imprecision are fit for intended use

2. Internal QC

- Conditions as on T=0 are still true

3. External QC

- What can be wrong?

Risk of new bias, with stable IQC

Risk of new bias, with stable IQC

Risk of new bias, with stable IQC

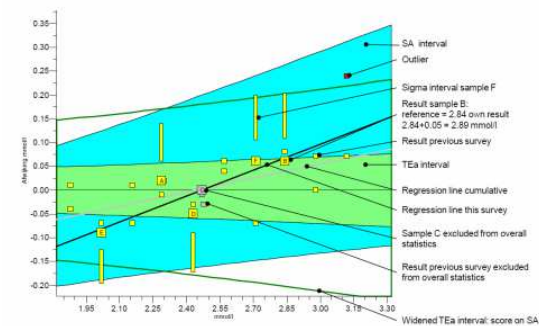

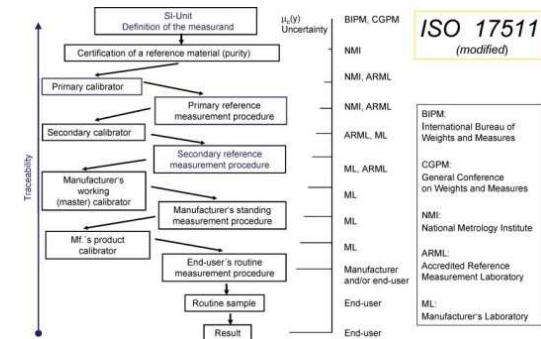

False alarm

- Goals:
 - Verification of trueness and imprecision
 - Verification of harmonisation
- Materials as intended by ISO17043: Commutable, homogenous, stable
 - Material cannot be blamed
- Value assignment in reference labs using reference methods
 - Value assignment cannot be blamed
- Smart reporting
 - Participant knows what to do

- **Specific:**
 - Performance of lab, not of EQAS material
 - material and assigned values beyond discussion
 - Support root cause analysis: method grouping
- **Measurable:**
 - mathematical relation between statistical dispersion of results and score
- **Achievable:**
 - if SA precision profile > Tea, then score in SA precision profile
- **Realistic:**
 - Tea based on EFLM performance goal criteria
 - Biological variation. Medical useful: relation to useable quality in RCV
 - Clinical outcome, when possible; troponin-T
- **Time dependent:**
 - Multiple time point evaluation:
 - Short term
 - Long term

SKML MUSE: multiple sample evaluation

In the difference plot 2 regression lines are shown. These are time-weighted and calculated from the results achieved in this survey (black line) and cumulative (grey line). The regression lines are calculated after removal of outliers; the within-lab scatter is calculated as the residual scatter of the results around these regression lines.

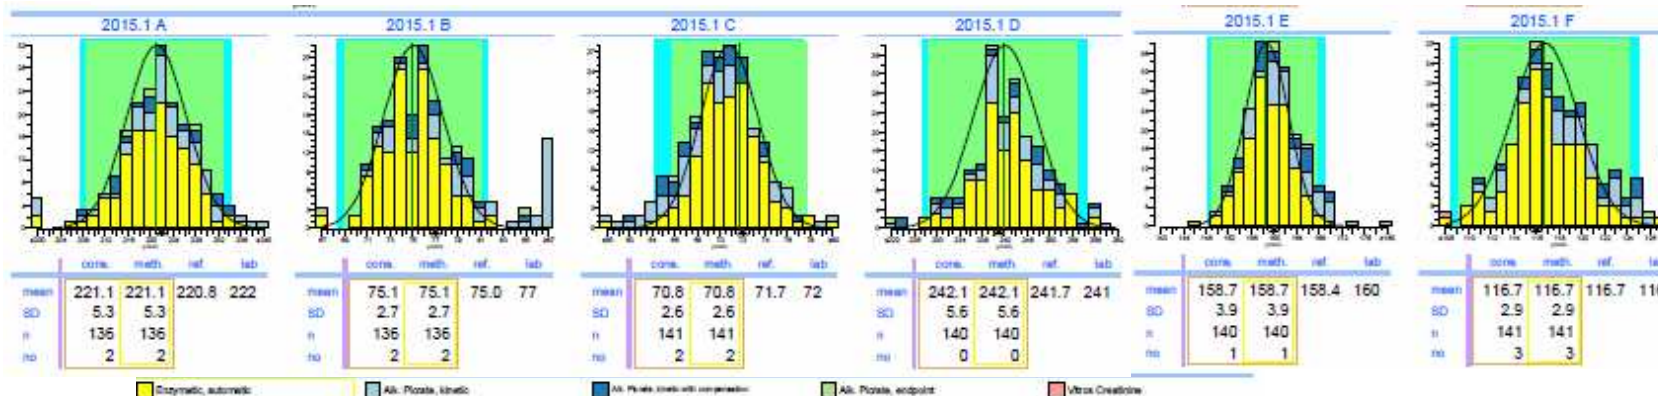

Example SKML MUSE report

Creatinine

units: $\mu\text{mol/L}$

	2015.1	cumulative
Trueness	+0.38%	+0.94%
Precision	0.90%	1.4%
Number	6	24
Outliers	0	0
Sigma-TE	4.6	4.2
Sigma-SA	5.0 2	4.6 2
Score pictogram		
Regression line	$0.0 + 1.003 \cdot x$	$0.0 + 1.011 \cdot x$
Consensus group	Enzymatische kreatinine	
Method	Enzymatic, automatic	
Analyser	Roche Cobas 6000	
Uw factor	$0 + 1.000 \cdot x$	
Methode factor	$-1 + 1.001 \cdot x$	

- Commutable materials
- Value assignment in reference labs
- PDCA facilitating reports

C. Cobbaert et al. / Clinica Chimica Acta 414 (2012) 234-240

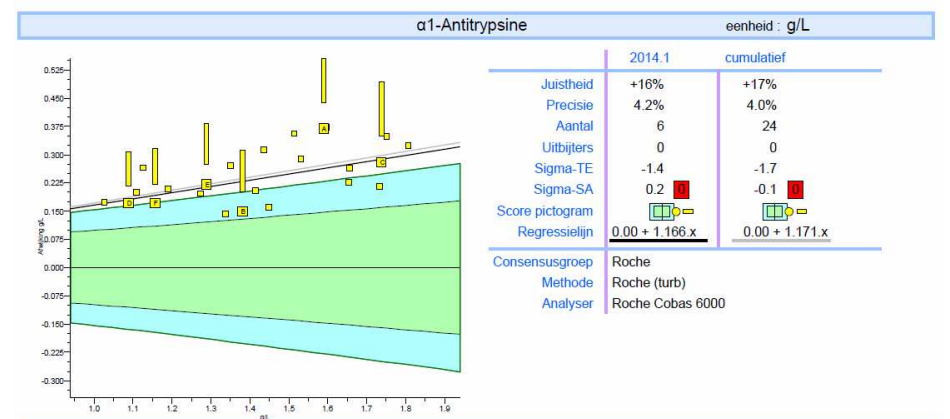

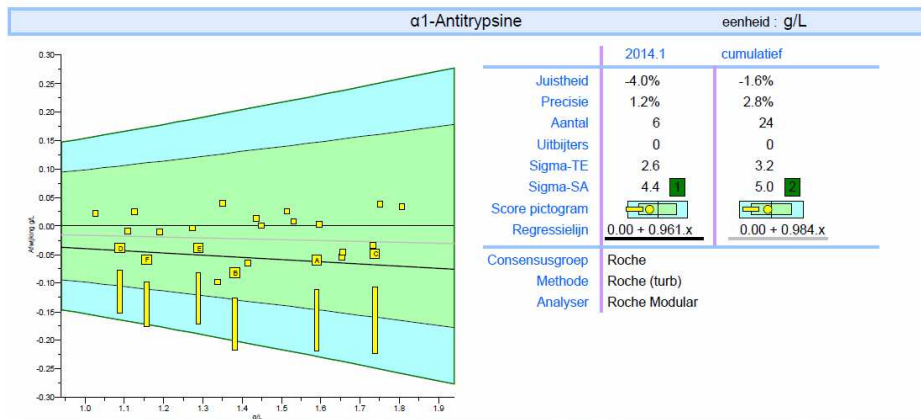

Trueness by consensus

Participant X

Participant Y

Stichting Kwaliteitsbewaking Medische Laboratoriumdiagnostiek **Combi Immunochemie 2014.1**

Stichting Kwaliteitsbewaking Medische Laboratoriumdiagnostiek **Combi Immunochemie 2014.1**

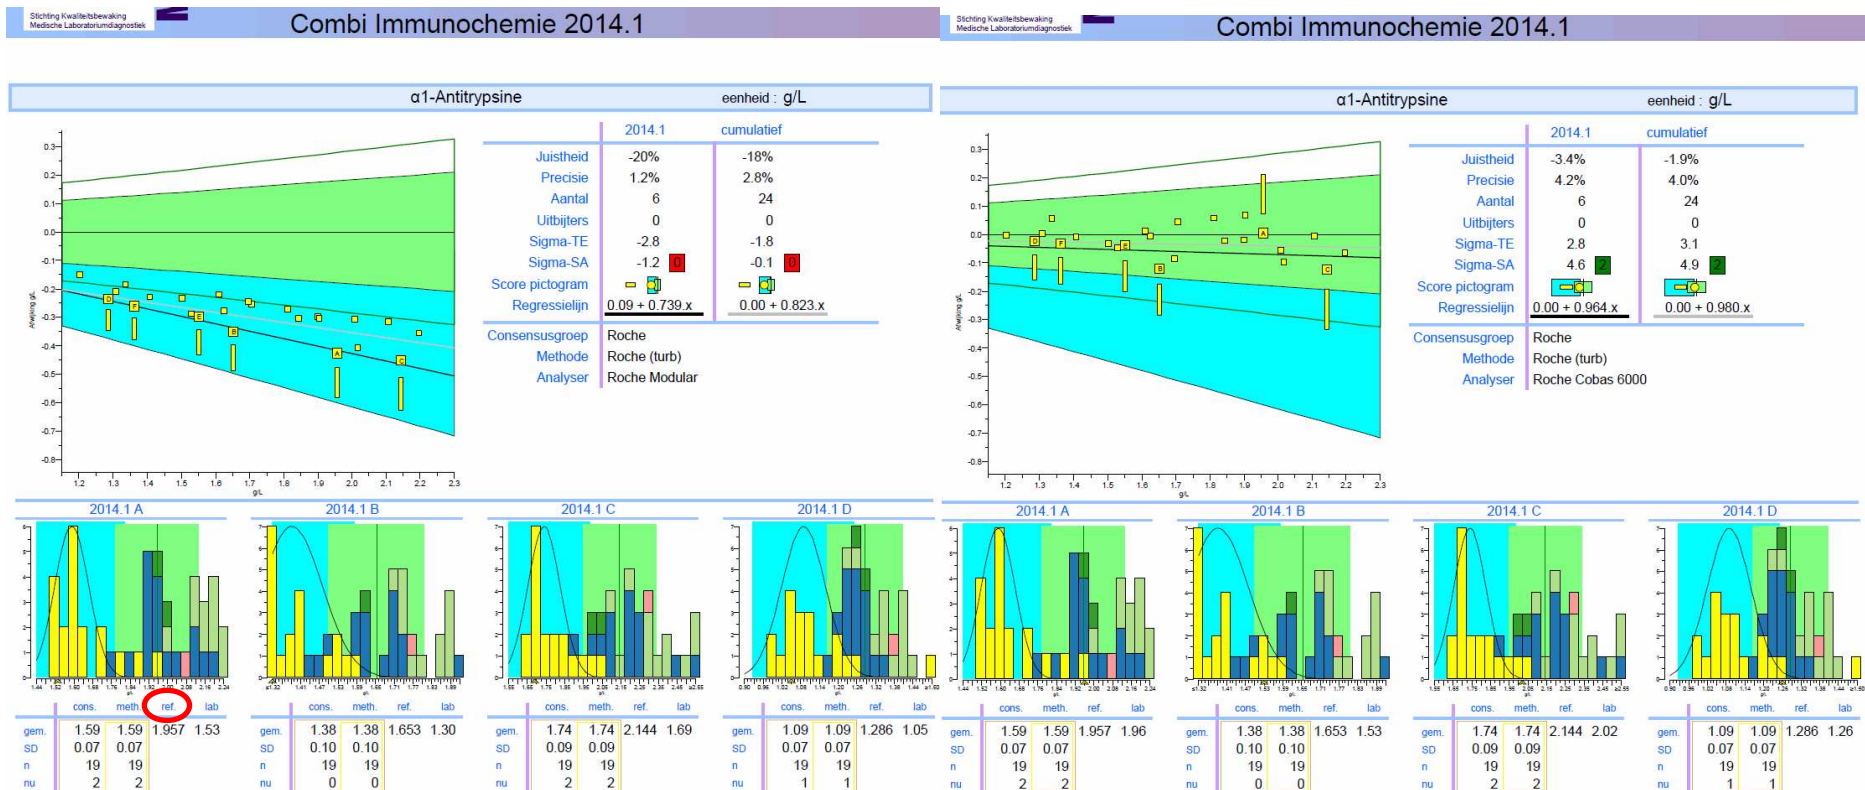

Difference between labs and methods reflects difference in patients

Trueness by reference method

Participant X

Participant Y

Who is right?

- 5-10 years experience in general chemistry with
 - Commutable materials
 - Value assignment in reference labsHas resulted in:
 - Improved between lab cv: harmonisation
 - Improved trueness: standardisation
- 2014 introduction of multi-sample score MUSE
- 2015 introduction of value assignment in protein chemistry

Room for improvement?
